

Shipping Location View — Sprint Analysis

Eligibility, order volume, manual enrollment, and rule prohibitiveness

Methodology (applies to all sections)

- Time window: 12 months, 3/12/2025 → 3/12/2026
- Excludes 3 shared credit card CMFs (130387900, 12121200, 144173500)
- "Orders" = contact-attributable orders (~19.5M annually). Orders without contact attribution can't get SLV regardless of rules, so they're outside scope
- Earlier 40.8M order figure was inflated by a contact→CMF join bug in `cmf_order_volume.total_orders`; corrected to ship-to-based 19.5M

1. CMF Eligibility

Table 1.1: Eligibility (Rules 1 & 3 applied at CMF level)

	CMFs	%
Eligible	1,026,627	89.6%
Non-eligible	118,842	10.4%
Total active CMFs	1,145,469	100%

Table 1.2: Why CMFs fail

Reason	CMFs	% of failures
Rule 3 only — excluded list code (gov/college/distributor)	105,763	89.0%
Rule 1 only — ≥10 contacts ordered in last 12mo	11,633	9.8%
Both rules	1,446	1.2%

Table 1.3: Ordering activity at active CMFs

Contacts who ordered in 12mo	CMFs	%
0	570,380	49.8%
1	366,029	32.0%
2–4	161,991	14.1%
5–9 (still eligible under R1)	~33,983	3.0%
≥10 (fails R1)	13,086	1.1%

- **89.6% of CMFs pass the CMF-level rules**, but ~82% of those have 0 or 1 ordering contact — technically eligible, but SLV has no coworkers to share with.
- The "real" SLV-relevant pool is the **~17% of CMFs with 2–9 ordering contacts (~196K CMFs)** — that's where shared view actually does something.

2. Order Eligibility (Corrected)

Table 2.1: Orders by CMF eligibility

	Orders	%
At eligible CMFs	14,675,817	75.3%
At non-eligible CMFs	4,809,497	24.7%
Total orders	19,485,314	100%

Table 2.2: CMFs vs. orders — the disparity

Segment	% of CMFs	% of orders	Order/CMF ratio
Eligible	89.6%	75.3%	0.84x
Non-eligible	10.4%	24.7%	2.4x

Table 2.3: High-activity CMFs (≥ 10 contacts — fail Rule 1)

	CMFs	Orders	Avg orders/CMF
High-activity	12,984	4,075,186	314
% of total	1.1%	20.9%	—

- **Big customers are disproportionately shut out:** 10.4% of CMFs account for 24.7% of orders — a 2.4x over-index.
- **Rule 1 alone shuts out 20.9% of all orders** from just 1.1% of CMFs — the headline exclusion.

3. Manual SLV Enrollment

Table 3.1: How contacts got SLV

	Contacts	%
Any manual enrollment	15,481	3.28%
Manual-only (no algo records)	10,680	2.26%
Both manual + algo	4,801	1.02%
Algorithm-only	456,369	96.72%
Total SLV-enrolled contacts	471,850	100%

- **~97% of SLV came from the algorithm;** ~3% from Sales manually flipping the toggle on webmaster/.
- **~10.7K contacts (2.3%) are "true overrides"** — Sales added them; the algorithm never qualified them. That's the cleanest measure of how often the auto-rules aren't enough.

4. Rule-by-Rule Prohibitiveness

All 4 rules measured against the same 19.5M contact-attributable order denominator.

Table 4.1: Ranked by orders excluded

Rank	Rule	What it does	Orders excluded	% of orders
1	R1	<10 active contacts at ship-to	4,075,186	20.9%
2	R4	Single non-individual billto	1,862,848	9.6%
3	R3	Listcode not gov/college/distributor	1,155,818	5.9%
4	R2	≥3 orders this ship-to	835,286	4.3%

Table 4.2: Ranked by entities failing

Rank	Rule	Pairs failing	% of pairs	Contacts shut out	CMFs
1	R2	644,137	46.8%	611,259	250,798
2	R1	264,974	19.2%	248,827	12,984
3	R3	113,008	8.2%	103,156	43,901
4	R4	95,569	6.9%	43,487	66,179

Table 4.3: R2 caller-name proxy (orders <3 in 12mo)

Caller names with...	Count	% of 1,386,228
1 total order in 12mo	506,925	36.6%
2 total orders in 12mo	185,179	13.4%
<3 total orders in 12mo	692,104	49.9%

Methodology

- R1 & R3 are CMF-level rules; R2 is contact-ship-to level; R4 is contact level. All converted to orders for apples-to-apples comparison.
- "Orders excluded" = orders this rule alone would block, assuming no other rules apply. Rules are not mutually exclusive — overlap exists.
- R2 measured two ways: strict (pairs with <3 orders to that ship-to) and proxy (caller names with <3 orders total).

Takeaways

- **R1 is the volume killer.** 1% of CMFs fail it, but they cover 21% of all orders — the big-customer exclusion is doing most of the work.
- **R2 is the headcount killer.** 47% of contact-ship-to pairs fail it, and **half of all caller names (49.9%) have <3 total orders in a year** — they can't qualify under R2 at *any* ship-to. R2 has the biggest "shut out but still visit the web" footprint.
- **R4 punches above its weight.** 7% of pairs fail it but 10% of orders excluded — multi-billto contacts are heavy orderers (~3× density).
- **R3 (listcode) is the smallest on both axes.** Real, but not the headline.
